

Hollow ArtPass Asset Creation Guide for Rafal

Practical checklist for creating visual-only meshes, materials, textures, VFX, audio placeholders, and prefab wrappers that bind into Hollow's ArtPass pipeline.

Purpose

This guide defines how Rafal can create visible assets that plug into Hollow's ArtPass pipeline without becoming gameplay-authoritative. Gameplay collision, movement, room layout, enemy behavior, traversal, and rewards remain controlled by code and runtime JSON.

Folder Targets

Use	Path
Raw intake from Blender/FBX/textures	Assets/_Hollow/Art/Intake/Rafal/
Clean source models	Assets/_Hollow/Art/Models/Rafal/
Textures	Assets/_Hollow/Art/Textures/Rafal/
Materials	Assets/_Hollow/Art/Materials/Rafal/
Runtime prefab wrappers	Assets/_Hollow/Prefabs/ArtPass/
Presentation catalog	Assets/_Hollow/Data/Presentation/

Naming Convention

Asset type	Format	Example
Mesh / FBX	SM_[Thing]_v01.fbx	SM_EnemyCharger_v01.fbx
Material	MAT_[Thing]	MAT_Rock_DarkStone
Texture	T_[Thing]_[Map]	T_Player_BaseColor
Prefab wrapper	AP_[PresentationPrefabRole].prefab	AP_EnemyCharger.prefab
VFX prefab	VFX_[CueOrRole].prefab	VFX_RewardClaim.prefab
Audio clip	SFX_[Cue]_v01.wav	SFX_DoorUnlock_v01.wav

Asset Targets

Group	Prefab roles / examples	Asset needs
Player	Player	Mesh, material, optional idle bob animation.
Enemies	EnemyNormal, EnemyFlying, EnemyFast, EnemyHeavy, EnemyCharger, EnemyTurret, EnemySplitter, EnemyBoss	Distinct silhouettes, readable color accents, simple materials.
Room	RoomFloor, RoomObstacleRock, DoorActive, DoorLocked, DoorCleared, DoorUnavailable, SecretDoorDebug	Meter-aligned pivots, no gameplay colliders.
Combat	Projectile, EnemyProjectile, melee/ranged weapon previews	Tiny readable shapes, VFX trails optional.

Group	Prefab roles / examples	Asset needs
Rewards	RewardPickup, BossKeyPickup, ActiveItemPickup, ConsumableCardPickup, Armor, WeaponMelee, WeaponRanged	Pickup silhouettes and icon-like readability.
Hub	HubShop, HubShopCard, NextBranchPortal, HubReturnPortal	Closed/open portal states and shop cards.
VFX / Audio	Enemy hit/death, projectile fire, reward claim, door unlock, portal complete	Prefab VFX plus short SFX clips where available.

Scale, Pivots, and Bounds

- Use meters. One tile is 1m x 1m. The floor top is $y = 0$.
- Rock obstacles should fit inside a 1m x 1m x 1m box with bottom at $y = 0$.
- Door props should sit with bottom at $y = 0$ and fit their lane visually.
- Small enemies should usually fit around 0.45m to 0.75m wide. Boss can be larger, around 1.2m to 1.4m as a prototype.
- Keep pivots at the logical placement origin. Avoid offset parent transforms unless the wrapper clearly documents it.

Export Settings

- Export FBX in meters, Y-up, with transforms applied.
- Keep meshes low-poly and Vision Pro safe. Prefer simple silhouettes over dense detail.
- Use 512 or 1024 textures for first-pass assets unless a specific hero object needs more.
- Use URP-friendly materials. Avoid expensive shaders, realtime transparency stacks, and unnecessary nested hierarchies.
- If animation is included, keep it simple: idle bob, hover, charge windup, portal pulse, reward sparkle.

Prefab Wrapper Rules

- Runtime-approved assets must be wrapped as prefabs under ``Assets/_Hollow/Prefabs/ArtPass/``.
- Visual prefabs must not contain gameplay colliders.
- Visual prefabs must not contain gameplay scripts such as enemy controllers, combat scripts, or room runtime scripts.
- Use renderers, VFX children, animation components, and ``PresentationVisualMarker`` only.
- The gameplay object instantiates the visual as a child; replacing art must never change collision or behavior.

How to Connect an Asset

- Create or import the mesh/material/texture.
- Create a prefab wrapper named for the presentation role, for example ``AP_EnemyCharger.prefab``.
- Add ``PresentationVisualMarker`` and set the correct role.
- Assign the prefab to the matching role in the presentation content catalog.
- Run ArtPass/content validation. Missing optional art is a warning; broken required bindings are errors.
- Open Room Designer Scene Mode or the game scene to confirm the art appears as a visual child only.

Common Mistakes

- Adding colliders to visual prefabs. Collision belongs to gameplay runtime objects.
- Using a pivot that makes rocks or doors float above the floor.
- Replacing a runtime prefab instead of binding a visual child through the ArtPass catalog.
- Creating a beautiful model that is unreadable from the game camera or Vision Pro tabletop scale.
- Forgetting `.meta` files or moving assets outside Unity, which breaks references.
